

Assembling your chair is a fairly simple process when you follow this sequence. (No tools required)

Once you have the parts unpacked the foot ring should slide on to the gas column first from the bottom tapered end.

The grey plastic ring insert goes in between the foot ring and the column - there is a slot in the plastic ring that lines up with a metal lug for the locking knob.

Once the foot ring is on drop the column in to the five star base.

Slide the plastic concertina sleeve over the column.

Then place the seat on top of the column - the hole it fits into is easy to see on the underside of the seat.

Take the back rest and slide it into it's position on the back of the seat base releasing the locking knob if necessary.

Once the seat back is in place, insert the small plastic button in to the hole at the bottom inside edge. This is to stop it being accidentally pulled out.

It is now ready to be sat upon and adjusted using the height, tilt and back support levers until you get a comfortable position.
